## ORACLE Academy

## **Objectives**

- This lesson covers the following objectives:
  - -Create and initialize one-dimensional arrays
  - -Modify an array element
  - -Traverse a one-dimensional array by using a for loop
  - -Identify the cause of an
    ArrayIndexOutOfBoundsException

ORACLE Academy

#### Can a Variable Hold More Than One Value?

- So far we have used many types of variables, but each variable stores one value at a time:
  - -one int or one String or one double
- Here's an example of a String variable, rockBand, that can hold any value – Joe, Paul, Ed, Rob:
  - -Since there are only 4 possible values, it isn't too difficult to change the variable's value manually

```
String rockBand = "Joe";
String rockBand = "Paul";
String rockBand = "Ed";
String rockBand = "Rob";
```

#### ORACLE

Academy

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

### Number of Variables Required

- But there are times when you'll need to hold more than one value in a variable
- What if you wanted to set aside a variable for each one of the RockBand songs? (That would be 300 variables for each song!)
- However, it can be time-consuming and tedious to create hundreds of variables

```
String rockBandSong1 = "Rainy day";
String rockBandSong2 = "Forever";
String rockBandSong3 = "Something about you";
String rockBandSong4 = "Love you always";
......
```

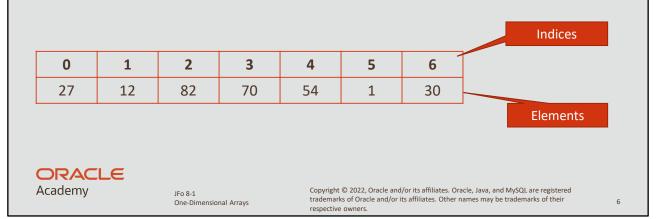

#### ORACLE

Academy

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

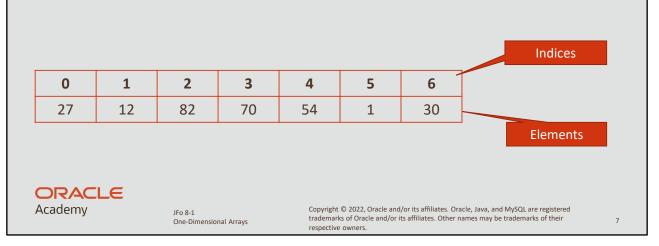

## Arrays Can Provide a Solution

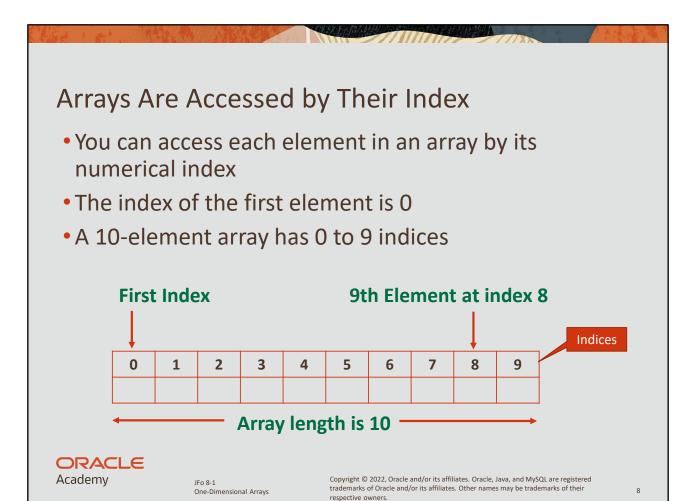

- In Java, an array is an indexed container that holds a set of values of a single type
- Arrays allow you to create a single identifier to organize many items of the same date type

## Arrays Can Provide a Solution

- Each item in an array is called an element
- Arrays make storing and accessing a large number of values simple and easy

The array is a container that holds a set of String values, a set of int values, a set of double values, and so on.

The elements (items) of the array are accessed through a numeric index. Using this index, you can set or get a value from a specific element.

## **Array Data Types**

- Arrays can be of any data type, but all elements have to share the same type, such as:
  - -Primitive:
    - Example: Array of int types

27	12	82	70	54	1	30
----	----	----	----	----	---	----

- -Predefined objects:
  - Example: Array of Strings

ın Mon	)	Sun Mon Tue	Wed	Thu	Fri	Sat
--------	---	-------------	-----	-----	-----	-----

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## **Array Data Types**

- Arrays can be of any data type, but all elements have to share the same type, such as:
  - -Programmer-defined objects:
    - (such as instances of a class that you create)
    - Example: Array of objects of the Student class

Student1	Student2	Student3	Student4	Student5

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## Declaring an Array

- Arrays, like all variables, must be declared prior to use
- You can declare an array by using the following syntax:

type[] arrayIdentifier;

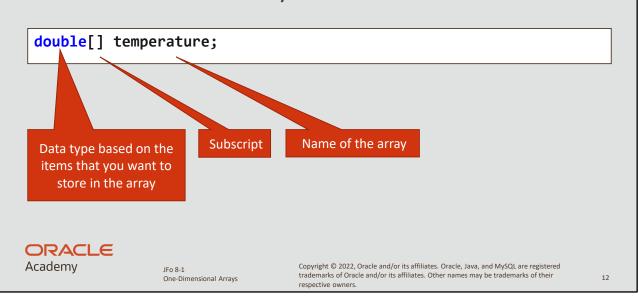

• Notice the bracket notation [] after the data type

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## Declaring an Array of Temperature Values

- Suppose you want to store different temperature readings in an array
- You can declare an array as follows:

## Declaring an Array: Two Methods

You can declare an array in two ways:

```
    int[] prime;
    int prime[];
```

- Both syntaxes are equivalent
- The first format generally is more readable and should be used

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## Is Declaring an Array Sufficient?

- Declaring an array isn't enough to begin using it in your program
- Before you use an array, you need to tell Java to create space in memory for the elements that it will hold

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## Is Declaring an Array Sufficient?

Use the following syntax:

```
data_type[] variable_name = new data_type[size];
variable_name[index] = value; //repeat for each element
```

- The size value determines the number of items that your array can hold
- Arrays can't grow beyond this size

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## Creating an Array

• For example, if you want to create an array to hold 100 integers, you could do the following:

```
int[] myIntArray;
myIntArray = new int[100];
```

 Alternatively, you could perform these two lines in one step:

```
int[] myIntArray = new int[100];
```

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

```
What Do the Code Snippets Do?
    int[] ages = new int[3];
    ages[0] = 19;
    ages[1] = 42;
    ages[2] = 92;
    String[] names = new String[3];
    names[0] =
                     "Mary";
    names[1] =
                     "Bob";
    names[2] =
                     "Carlos";
     Variable Name
                          Index
                                       Value
ORACLE
Academy
                                             Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered
                      IFo 8-1
                                             trademarks of Oracle and/or its affiliates. Other names may be trademarks of their
                                                                                               17
                      One-Dimensional Arrays
                                             respective owners.
```

The first code snippet creates an integer array of ages with three elements. The second code snippet creates a String array of names with three elements.

## What About Declaring and Initializing an Array in a Single Step?

 You can also declare and initialize the array in a single step with known values:

```
type[] arrayIdentifier = {comma-separated list of values};
```

 For example, declare arrays of types String and int:

```
String[] names = {"Mary", "Bob", "Carlos"};

int[] ages = {25, 27, 48};

Declaration
and
initialization
in one step

ORACLE

Academy

JFo 8-1
One-Dimensional Arrays

```

## What About Declaring and Initializing an Array in a Single Step?

- Notice that this method doesn't specify size
- It's assigned a size based on the number of elements between the braces ( { } )

```
String[] names = {"Mary", "Bob", "Carlos"};

int[] ages = {25, 27, 48};

Declaration
and
initialization
in one step

Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.
```

### **Accessing Array Elements**

- Arrays are sequential structures, meaning that items are stored one after another in an array
- You can access an individual element of an array by using a bracket notation
- For example, here's how you get values from the ages array:

```
int[] ages = {25, 27, 48};
int myAge = ages[0];
int yourAge = ages[1];
System.out.println("My age is " + ages[0]);
```

ORACLE

Academy

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## How Do You Set the Value of an Array Element?

You can set values to the array's elements like this:

```
String[] names = {"Mary", "Bob", "Carlos"};
names[0] = "Gary";
names[1] = "Rob";
```

 After you set the values to the elements at indices 0 and 1, the names array looks like this:

0	1	2	
Gary	Rob	Carlos	
names[0]	names[1]	names[2]	

Academy

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

#### Exercise 1

- Can you identify the three components of an array declaration for each of these arrays of primitive data types?
  - -Data Type
  - -Name
  - -Size

```
int[] myArray;
myArray = new int[20];
char[] sentence = new char[100];
double[] teamPoints = new double[5];
```

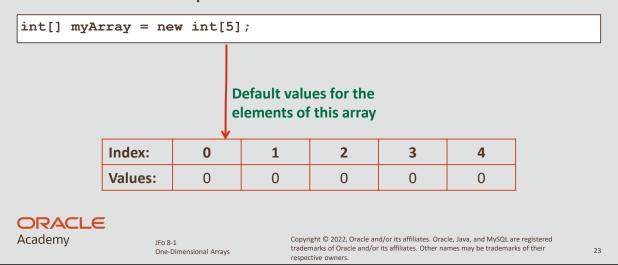

ORACLE

Academy

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## **Default Initialization of Arrays**

- When arrays are declared but not yet initialized, the elements are given the default value associated with the data type
- Here's an example:

Here are the default initializations for arrays of different data types:

Numeric values: int: 0, double: 0.0)

Boolean values to false

char values to '\u0000' (unicode for blank character)

Object types such as String to null

### How Do You Access the Length of an Array?

- So far, you created an array with a certain number of elements
- After creation, you can't change the length of an array.
   They can't grow beyond this size
- You can access the size of any array by using the array's length property

```
int primes[] = {2, 3, 5, 7, 11, 13, 17};
System.out.println("Array length: " + primes.length);
//prints 7
```

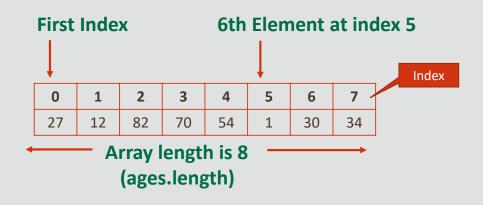

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## Array Indices and Length

• For example, the following code snippet displays the size of the ages array:

```
int ages[] = {27, 12, 82, 70, 54, 1, 30, 34};
System.out.println(ages.length); //prints 8
```

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

#### Exercise 2

- Create a new project ArrayEx and add the ArrayEx1.java file to the project
- Examine ArrayEx1.java
- Modify the program to implement ...
  - Declare a one-dimensional array named score of type int that can hold 9 values
  - Declare and initialize a one-dimensional byte array named values of size 10 so that all entries contain 1
  - Uncomment the two lines that are commented out and then resolve the syntax errors

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## Traversing an Array

- To iterate through, or traverse, an array means to process through each element of the array by index number
- You can access each element of an array to ...
  - -Print the elements
  - -Search for an element
  - -Initialize the elements of an array with the same value

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

### Using a for Loop to Traverse Arrays

- You can use a for loop to traverse arrays
- The for loop lets you easily iterate over a known range
- You can visit every array element by using the length property of the array in the iteration condition

```
int[] array = { -20, 19, 1, 5, -1, 27, 19, 5 };
int min = array[0]; // initialize the current minimum
for (int index=0; index < array.length; index++ )
   if (array[index] < min)
        min = array[index];
System.out.println("The minimum of this array is: " + min);</pre>
```

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## How Do You Print the Values of a names Array?

Consider an array of Strings, names:

```
String names[] = {"Tom", "David", "Mike"};
```

Traverse the names array by using the for loop:

```
for (int idx = 0; idx < names.length; idx++){

System.out.println(names[idx]);
}//end for

Counter used as the index of the array

Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.
```

## Using a for-each Loop to Traverse an Array

- You can use a for-each loop, an alternative to using the for loop, to iterate through an array
- The for-each loop ...
  - Works the same way as the for loop, but it's implemented in a simpler way
  - -Is also called an enhanced for loop

JFo 8-1 One-Dimensional Arrays  $\label{eq:copyright} \ \textcircled{2022, Oracle} \ and/or \ its \ affiliates. Oracle, Java, and MySQL \ are registered trademarks of Oracle \ and/or \ its \ affiliates. Other names \ may be trademarks of their respective owners.$ 

## Using a for-each Loop to Traverse an Array

### • Syntax:

```
for (<type> <iteration variable> : <array name>) {
      <code_block to be performed for each arrayelement>
}//end for
```

JFo 8-1 One-Dimensional Arrays  $\label{eq:copyright} \ \textcircled{0} \ 2022, Oracle \ and/or \ its \ affiliates. Oracle, Java, \ and \ MySQL \ are \ registered trademarks of Oracle \ and/or \ its \ affiliates. Other names may be trademarks of their respective owners.$ 

## How Do You Print the Values of a names Array by Using a for-each Loop?

 Here's an example of traversing the names array by using a for-each loop:

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## How Do You Print the Values of a names Array by Using a for-each Loop?

- For each iteration of the loop, the next element in the array is retrieved and stored in an iteration-variable
- The type must be the same as the elements stored in the collection

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## for-each Loop vs. for Loop

for-each loop

```
for(String name: names){
    System.out.println(name);
}//end for
```

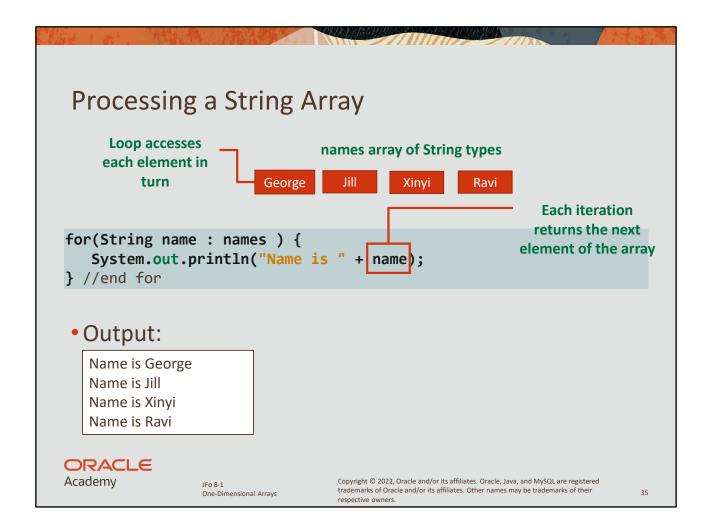

for loop

```
for (int idx = 0; idx < names.length; idx++){
    System.out.println(names[idx]);
}//end for</pre>
```

The output of both loops is the same

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

The slide example shows four elements in the names array. The code block executes four times, and the name variable holds a different array element each time.

## Putting It All Together

- Let's look at an example where you need to ...
  - -Enter the scores of 10 students by using a Scanner object
  - -Display the scores that you entered
  - -Calculate the average of the scores that you entered

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## Let's Compute the Average Score

```
public class StudentScores {
    public static void main(String args[]) {
        double scores[] = new double[10];
        double sum = 0.0, avg = 0.0;
        Scanner keyboard = new Scanner(System.in);
        System.out.println("Enter scores of 10 students");
        for(int i = 0; i < scores.length; i++) {</pre>
            scores[i] = keyboard.nextInt();
        }//end for
        System.out.println("Display the scores of 10 students");
        for(int i = 0; i < scores.length; i++) {</pre>
            System.out.println(scores[i]);
        }//end for
        for(int i = 0; i < scores.length; i++) {</pre>
            sum = sum + scores[i];
            avg = sum / scores.length;
        }//end for
        System.out.println("The average score of the class: " + avg);
     }//end method main
 }//end class StudentScores
ORACLE
Academy
                                          Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered
                     IFo 8-1
                                          trademarks of Oracle and/or its affiliates. Other names may be trademarks of their
                     One-Dimensional Arrays
                                                                                          37
                                          respective owners.
```

In the slide example, the program prompts you to enter one score for 10 students of a class by using the Scanner class. The scores are stored in an array called scores. Next, the scores stored in the array are printed to the console by traversing the array with a for loop. Using another for loop, the sum of the 10 scores is computed, and the average score is obtained by dividing the sum by 10 (that is, the total number of scores). Finally, the average score of the class is displayed.

#### Exercise 3

- Add the file ComputeAvg.java to the project you created for exercise 2
- Examine ComputeAvg.java
- Modify the program to implement ...
  - In a certain class, there are five tests, each worth 100 points
  - Input five test scores from the console
  - Store the test scores in an array
  - Calculate the student's average scores

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

### What is an ArrayIndexOutOfBoundsException?

- As you already know, an array has a fixed size
- The index must be in a range interval [0, n-1], where n is the size of the array
- If an index is either negative or greater than or equal to the size of the array, then the array index is out of bounds
- If an array index is out of bounds, the JVM throws an ArrayIndexOutOfBoundsException
- This is called automatic bounds checking

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## What Happens When This Exception Occurs?

- The ArrayIndexOutOfBoundsException is thrown only at run time
- The Java compiler doesn't check for this exception when a program is being compiled
- The program is terminated if this exception isn't handled

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## How Do You Identify the ArrayIndexOutOfBoundsException?

```
public static void main(String[] args) {
    int primes[] = {2, 3, 5, 7, 11, 13, 17};
    System.out.println("Array length: " + primes.length);
    primes[10] = 20; //

    System.out.println("The first few prime numbers are:");
    for (int i : primes) {
        System.out.println(i);
    }//end for
}//end method main
The index of the array is
access an element at
index 10
```

#### • Output:

```
Array length: 7
Exception in thread "main"
java.lang.ArrayIndexOutOfBoundsException: 10
at arraysdemo.ArraysDemo.main(ArraysDemo.java:21)
Java Result: 1
```

#### ORACLE

Academy

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

#### Exercise 4

- Add the file ArrayEx2.java to the project you created for exercise 2
- Examine ArrayEx2.java
- Perform the following:
  - -Run the program and observe the error
  - -Modify the program to resolve the error
  - Using a for-each loop, display all browsers that are stored in the array

JFo 8-1 One-Dimensional Arrays Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

## Summary

- In this lesson, you should have learned how to:
  - -Create and initialize one-dimensional arrays
  - -Modify an array element
  - -Traverse a one-dimensional array by using a for loop
  - -Identify the cause of an ArrayIndexOutOfBoundsException
