ORACLE Academy

Objectives

- This lesson covers the following objectives:
 - -Understand default values
 - -Crash the program with a null reference
 - -Understand the default constructor
 - -Write a constructor that accepts arguments
 - -Initialize fields with a constructor
 - -Use this as an object reference

JFo 7-3 Constructors

Remember the Prisoner Class

- It may have looked like this code
- It contains fields and methods

```
public class Prisoner {
    //Fields
    public String name;
    public double height;
    public int sentence;

    //Methods
    public void think(){
        System.out.println("I'll have my revenge.");
     }//end method think
}//end class Prisoner
```

Fields Are Variables

- Variables hold values
- The values can be accessed.
- Code may need to access variables to ...
 - -Make calculations
 - -Check current values
 - -Change a value
- What might happen if a field is accessed before it's assigned a value?

JFo 7-3 Constructors

Exercise 1

- Continue editing with the PrisonTest project
 - -A version of this program is provided for you in the files PrisonTest_Student_7_3.java and Prisoner Student 7 3.java
- Investigate what happens when fields are accessed before they're assigned values
 - -Instantiate a Prisoner
 - -Try printing the value of each field

Variable: p01 Name: ??? Height: ??? Sentence: ???

ORACLE Academy

JFo 7-3 Constructors

Accessing Uninitialized Fields

- If fields aren't initialized, they take on a default value
- Java provides the following default values:

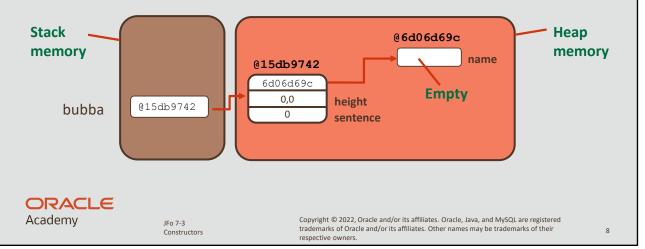

Data Type	Default Value
boolean	false
int	0
double	0.0
String	null
Any Object type	null

Academy JF0 7-3
Constructors

Null Object References

- Objects can have a null value
- A null object points to an empty location in memory
- If an Object has another Object as a field (such as a String), its default value is null

Accessing Null Objects Is Dangerous

- What if a null object contains a field or method that needs to be accessed?
 - -This causes the program to crash!
 - -The specific error is a NullPointerException

```
public static void main(String[] args){
   String test = null;
   System.out.println(test.length());
}//end method main
```

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

The Importance of Initializing Fields

- It's always good to minimize the chances that your program will crash
- · And sometimes, Java's default values aren't desirable
- The remaining topics in this lesson examine helpful alternatives for initializing fields

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Setting Prisoner Fields

- Currently, we need a line of code to set each field
- Four lines are required for each Prisoner object

```
public class PrisonTest {
   public static void main(String[] args){
      Prisoner p01 = new Prisoner();
      Prisoner p02 = new Prisoner();

      p01.name = "Bubba";
      p01.height = 2.08;
      p01.sentence = 4;
      p02.name = "Twitch";
      p02.height = 1.73;
      p02.sentence = 3;
   }//end method main
}//end class PrisonTest
```

Methods Make Code More Efficient

- If you find yourself repeating similar lines of code ...
 - -Programming can become tedious
 - -It may be possible to do the same work in fewer lines
 - -Try to write that code as part of a method instead

```
p01.name = "Bubba";
p01.height = 2.08;
p01.sentence = 4;

p02.name = "Twitch";
p02.height = 1.73;
p02.sentence = 3;
Repeated
```

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Exercise 2

- Continue editing with the PrisonTest project
- Can fields be set more efficiently?
 - -Add a setFields() method to the Prisoner class
 - This method should take three arguments, which are used to set the values for every field
 - -Replace code in the main method with calls to this method

Variable: p01
Name: Bubba
Height: 6'10"
(2,08m)

Sentence: 4 years

Variable: p02
Name: Twitch
Height: 5'8"
(1,73m)
Sentence: 3 years

Academy

JFo 7-3 Constructors

Writing a Method to Set Fields

Your solution may have looked something like this:

```
public class Prisoner {
   public String name;
   public double height;
   public int sentence;

public void setFields(String n, double h, int s){
    name = n;
    height = h;
    sentence = s;
}//end method setFields
}//end class Prisoner
```

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Setting Prisoner Fields

- Two lines are required for each Prisoner object
- But it's possible to do the same work in even fewer lines!

```
public class PrisonTest {
   public static void main(String[] args){
     Prisoner p01 = new Prisoner();
     Prisoner p02 = new Prisoner();

     p01.setFields("Bubba", 2.08, 4);
     p02.setFields("Twitch", 1.73, 3);

}//end method main
}//end class PrisonTest
```

Calling a Constructor

- A constructor is a special method
- Its goal is to "construct" an object by setting the initial field values
- An object's constructor is called once
 - -This occurs during instantiation
 - -And is never called again
- We've been calling constructors this whole time

Constructor method call

Prisoner p01 = new Prisoner();

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

The Default Constructor

- Java automatically provides a constructor for every class
- It's never explicitly written in a class
- This is called the default constructor
- It's considered a zero-argument constructor

Accepts zero arguments

Prisoner p01 = new Prisoner();

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Writing a Constructor Method

- You can replace the default constructor with a constructor that you wrote yourself
- Constructors are written like any other method, except:
 - -They have no return type (not even void)
 - -They're named the **same** as the class

```
//Constructor
public Prisoner(){
    System.out.println("This is a constructor");
}//end constructor
```

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Exercise 3, Part 1

- Continue editing with the PrisonTest project
- Copy the constructor into the Prisoner class
 - -Run the program
 - Observe how the code in this method is executed when Prisoner objects are instantiated

```
//Constructor
public Prisoner(){
    System.out.println("This is a constructor");
}//end constructor
```

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Exercise 3, Part 2

- How could you modify this constructor so that it sets every field in the class?
 - -Use your understanding of methods to find a solution
 - -Remember, constructors are methods
 - -Remove the setFields() method
 - -Your solution should make this method redundant
- Your IDE will complain in the main method:
 - -How could these issues be fixed?
 - -Run the program after you have a solution

JFo 7-3 Constructors

You May Have Noticed ...

- Constructors can be written so that they accept arguments that set initial field values
- When you write your own constructor, the default constructor is no longer available
- Code becomes more useful and requires fewer lines
 - -The next few slides illustrate this increased efficiency

```
//Constructor
public Prisoner(String n, double h, int s){
    name = n;
    height = h;
    sentence = s;
} //end constructor
```

Setting Fields Without a Constructor

Academy

JFo 7-3

Constructors

• 4 lines are required for each Prisoner object

```
public class PrisonTest {

public static void main(String[] args){
    Prisoner p01 = new Prisoner();
    Prisoner p02 = new Prisoner();

p01.name = "Bubba";
    p01.height = 2.08;
    p01.sentence = 4;

p02.name = "Twitch";
    p02.height = 1.73;
    p02.sentence = 3;
}//end method main
}//end class PrisonTest
```

respective owners.

Naming Parameters

- Single-character variable names are commonly used ...
 - -If the variable has a very limited scope
 - -If there aren't a lot of variables to keep track of
 - -For testing purposes
- But earlier in this course, we encouraged giving variables a descriptive names
 - -This helps avoid confusion
 - -Definitely follow this convention for fields
 - Some developers like to apply this convention to method parameters

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Naming Parameters the Same as Fields

- This is also a common practice, especially with constructors
 - -It's clearer what your parameters refer to
 - -But this creates scope complications
- In the following code, is the name field or parameter printed?

```
public class Prisoner {
   public String name;

   public setName(String name){
      System.out.println(name);
   }//end method setName
}//end class Prisoner
```

ORACLE

Academy

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Which Version of name Is Printed?

- The parameter is printed
 - -Variables within the most local scope take priority
 - -In other words, the variables within the most recent scope
- Can the field still be accessed?
 - -Yes! Fields exist within the scope of their class methods
 - -But more syntax is required to access to them

```
public class Prisoner {
   public String name;

   public setName(String name){
      System.out.println(name);
   }//end method setName
}//end class Prisoner
```

ORACLE

Academy

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

The this Keyword

- this is a reference to the current object
 - -You can treat it like any other object reference
 - -Which means you can use the dot operator (.)
- this.name accesses the Prisoner's field
- this.setName() accesses the Prisoner's method

```
public class Prisoner {
   public String name;

   public setName(String name){
      System.out.println(name);
   }//end method setName
}//end class Prisoner
```

ORACLE

Academy

Exercise 4

- Modify the Prisoner constructor
 - -Change the parameters of this method so that each parameter's name matches the name of a field
 - -Set each field's value by using the this keyword

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Summary of Constructors

- Are special methods in a class
- Named the same as the class
- · Have no return type (not even void)
- Called only once during object instantiation
- May accept arguments
- Used to set initial values of fields
- If you don't write your own constructor, Java provides a default zero-argument constructor

JFo 7-3 Constructors Copyright © 2022, Oracle and/or its affiliates. Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Summary

- In this lesson, you should have learned how to:
 - -Understand default values
 - -Crash the program with a null reference
 - -Understand the default constructor
 - -Write a constructor that accepts arguments
 - -Initialize fields with a constructor
 - -Use this as an object reference
